DEPARTMENT OF ORAL MEDICINE AND RADIOLOGY

SEPTEMBER 2026

Total no. of OPD patient for the month -11,511

Details of major clinical procedure being performed-

S/n	OPD No.	Age / Gender	Clinical & Radiographic Findings	Provisional Diagnosis	Special Remarks
1	749335	39/M	White plaque like lesion seen on buccal mucosa bilaterally , it is non scrapable , leathery in consistency , showing cracked mud appearance, extends from third molar to the inner corner of mouth of buccal mucosa and vestibule on the left side and extends from 44 to 47 region of buccal mucosa and vestibule on the right side	White plaque like lesion bilaterally present on buccal mucosa – leukoplakia D/D – plaque like lichen planus	White plaque like lesion seen bilaterally on buccal mucosa showing cracked mud appearance, non scrapable requirement of incisional biopsy for histopathological investigation.
2	748286	31/F	A solitary, well circumscribed pigmented macule on left buccal mucosa. Brown to black in colour, generally asymptomatic with no pain or bleeding. Surface is smooth and intact. No associated ulceration, discharge or regional lymphadenopathy	Intraoral melanocytic nevus on left buccal mucosa- oral melanocytic nevus D/D- melanocytic macule, amalgam tattoo, malignant melanoma.	Biopsy/excision is required for histopathological confirmation, particularly because oral lesions should be differentiated from melanocytic macule, amalgam tattoo, malignant melanoma.
